Scope Note for: Carcinoma

MeSH HEADING: CARCINOMA

SCOPE: A malignant neoplasm made up of epithelial cells tending to infiltrate the surrounding tissues and give rise to metastases. It is a histological type of neoplasm but is often wrongly used as a synonym for "cancer." (From Dorland, 27th ed)

NOTE: do not use for "cancer" routinely: use only for carcinoma as a histological type: Manual 24.2.1.3; /blood supply /chem /second /secret /ultrastruct permitted; coord IM with precoord organ/neopl term (IM); X ref CARCINOMA, ANAPLASTIC: do not coord with ANAPLASIA unless anaplasia is particularly discussed

View Abstract

AB BACKGROUND: Subcutaneous allergen-specific immunotherapy (SIT) has an early onset of action, whereas repeated injections and safety concerns have limited its use in the pediatric age group. Meanwhile, the improved safety profile of the sublingual route has been accepted as an alternative despite its relatively late onset of action. OBJECTIVE: We sought to improve the efficacy and safety of SIT with a combination of the subcutaneous route in the build-up phase and sublingual maintenance in comparison with the sublingual or subcutaneous routes alone. METHODS: Fifty-one house dust mite-sensitized children with mild-to-moderate asthma were randomized into one of 4groups to receive either (1) subcutaneous immunotherapy (SCIT), (2) sublingual immunotherapy (SLIT), (3) SCIT plus SLIT, or (4) pharmacotherapy. Clinical parameters were evaluated at baseline and months 1, 4, 12, and 18. Allergen-specific immunoglobulin levels and allergen-induced IL-5, IL-10, IL-13, IL-17, TGF-, and IFN- levels were evaluated as well. RESULTS: In the SCIT and SCIT plus SLIT groups, the number of asthma attacks and inhaled corticosteroid dosage decreased compared with baseline values at
